Revel,

I was fortunate enough to find your job listing for the Software Engineer (Python) position in Atlanta. I feel that it would be both an opportunity to contribute to Revel's mission and progress my career.

I love Python. You won't find any position on my resume that pertains completely to the language, but I've implemented many lines as special projects both professionally and personally. These include a deep learning model to diagnose the speech disorder Dysarthria; a back port of nested exceptions to Python 2; the fastest, most minimal web server I could conceive; and Chick-fil-A's enterprise search ETL pipeline.

I've spent the last year leading a team of onshore and offshore team members working on Chick-fil-A's E-commerce website. It's given me a chance to practice delegation and leadership; think about higher-level architectural decisions; and bring out the potential in others. Some personal achievements include reducing the site's overall latency by 58% and spearheading the development of their Python-based site performance and monitoring system.

It's been a very rewarding experience, but I'm ready for the next challenge. Some specific areas I'd like to grow in, if given the opportunity, are REST API design and real-time processing. I hope you'll find that I have strong fundamentals and a desire to continue improving my craft with Revel.

Best,

Alex Mayle
